## A Appendix Figures

Figure A1: World Bank contractors and African Development Bank subcontractors by country of origin

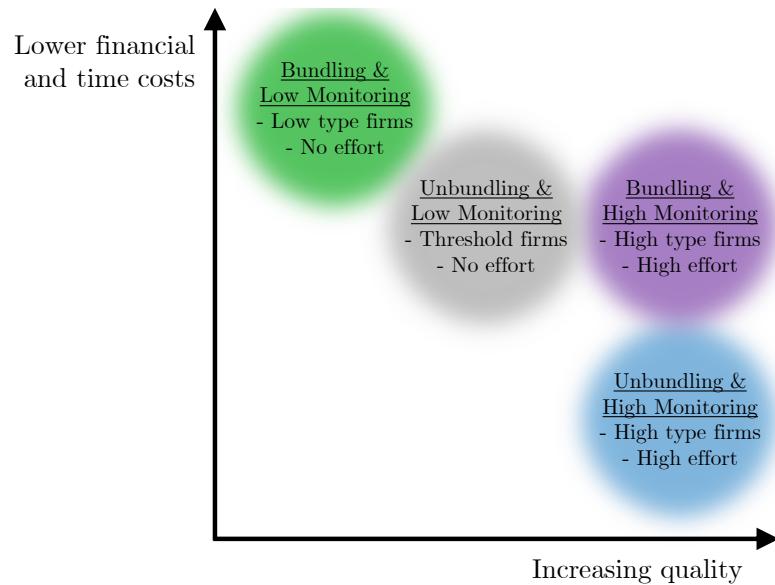

Notes: 59 companies were either awarded World Bank (WB) contracts or were approved to subcontract with one of the African Development Bank (AfDB) contractors for the procurement of poles, conductors, cables, or installation. This graph shows the distribution of countries of origin of these 59 companies. AfDB subcontractors are inverse-weighted by the number of good-specific subcontractors for which that AfDB contractor got approval, as most likely only one was used per good.

Figure A2: Site-level nighttime radiance by funding source, national  
Panel A Panel B

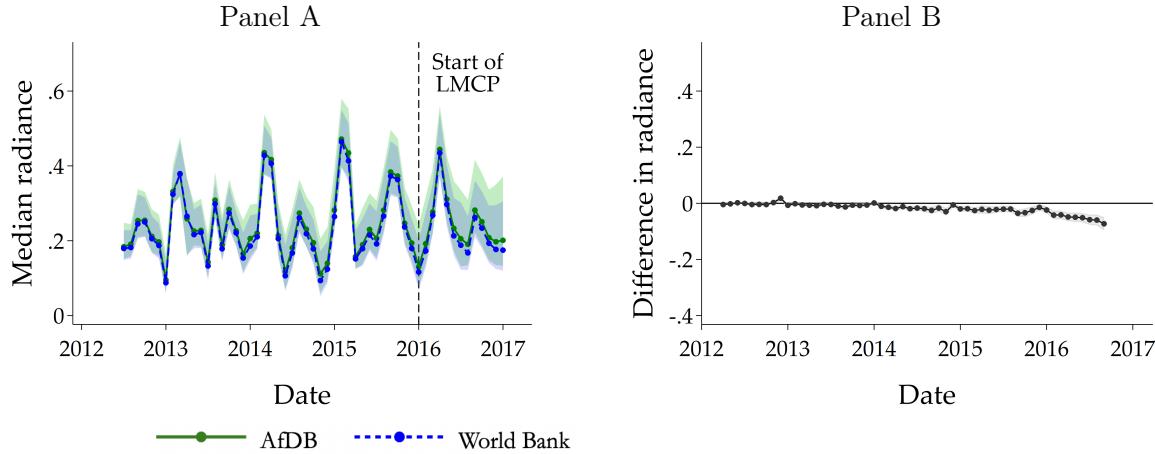

Notes: Panel A displays a ready board provided by a WB-funded contractor. Panel B displays a ready board provided by an AfDB-funded contractor.

Figure A3: Schematic of monitoring and bundling structures

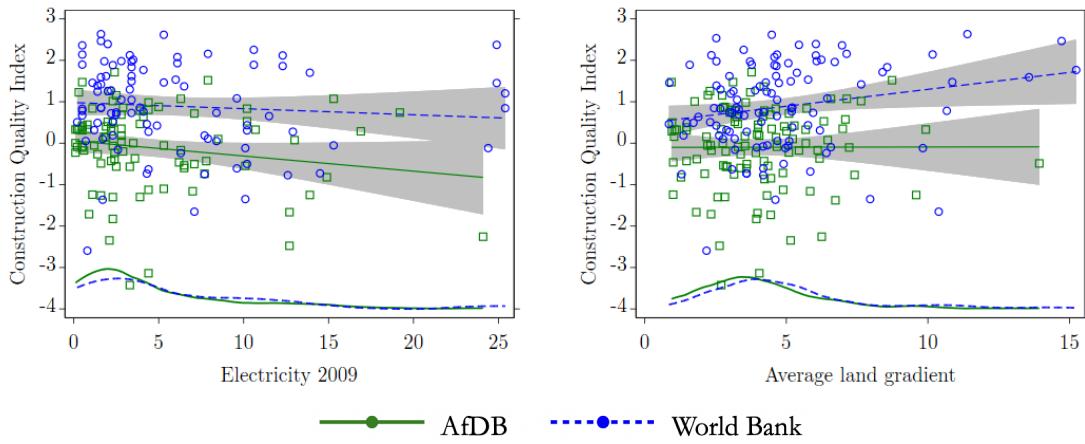

Notes: A graphical representation of how different monitoring levels (low or high) and contracting structures (unbundled or bundled components) affect quality and costs through the lens of the framework presented in [Section 5](#). Aggregate net benefits generally increase as financial and time costs decrease and quality increases, but the exact indifference curves depend on how the principal values cost and timeliness vis-a-vis quality, which is determined by, for example, their intertemporal discount rate. The green area (top left) approximates the structure used by the African Development Bank for the LMCP in Kenya. The blue area (bottom right) approximates the structure used by the World Bank for the LMCP in Kenya. The conceptual framework suggests that combining bundled contracts with high monitoring can generate similar quality as unbundled contracting but with significantly fewer delays and administrative costs. The purple area (middle right) approximates this structure, which we empirically evaluate this using a randomized audits experiment. The gray area is unobserved in our context; placement reflects the framework's predictions.

Figure A4: Site-level nighttime radiance by funding source, national

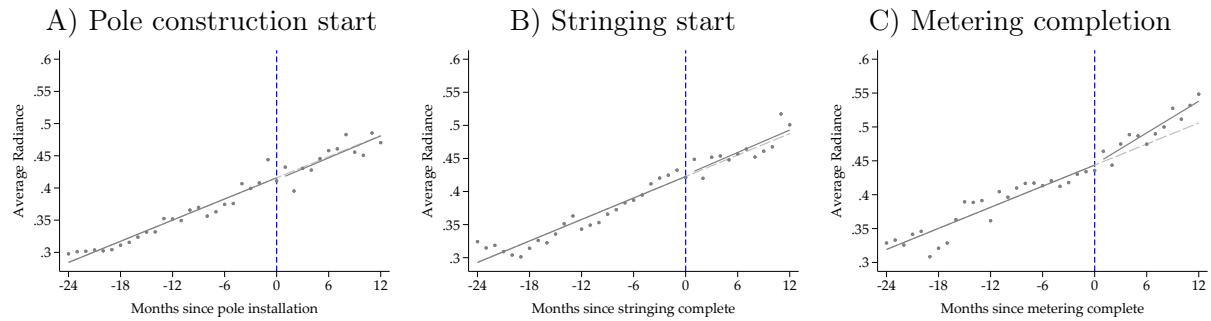

Notes: Panel A presents median monthly nighttime radiance from the Visible Infrared Imaging Radiometer Suite (VIIRS) between 2012-2017 per month, with bands showing the 25th to 75th percentile across sites, before and after the start of the Last Mile Connectivity Project (LMCP). Panel B shows imbalance that is statistically significant in later years, but economically small across World Bank and African Development Bank-funded sites (estimates include constituency fixed effects). [Table 2](#) demonstrates baseline balance using a pooled regression of these data. [Figure 9](#) performs the same analysis on the study sample of transformers and finds no statistically detectable relationship between radiance and funder assignment.

Figure A5: Construction Quality, Gradient, and Electricity Access

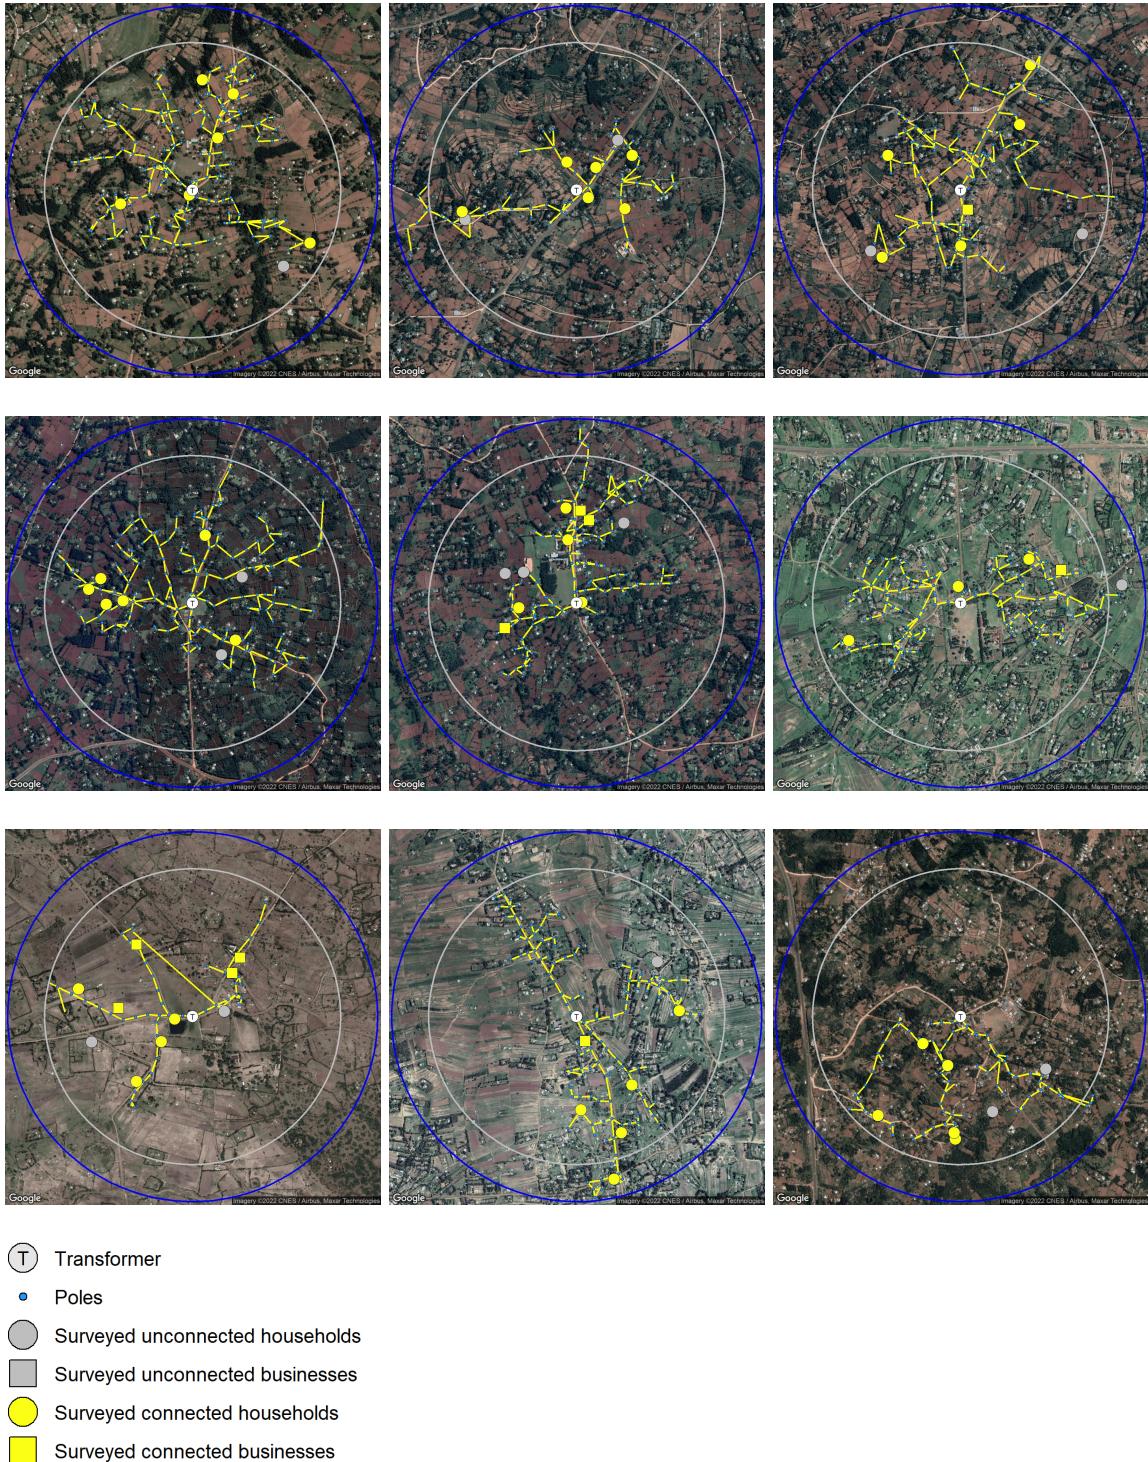

Notes: Differences in construction quality between WB and AfDB are approximately constant across the distribution of baseline electricity access and land gradient. Baseline electricity data from Kenya National Bureau of Statistics (2006; 2009). Average land gradient is calculated for each site over the 600 meter radius around its transformer using the 90-meter Shuttle Radar Topography Mission Global Digital Elevation Model.

Figure A6: Event study: nightlights after construction progress

Notes: Data on construction progress collected through phone surveys with local village representatives. As expected, nighttime radiance data (Elvidge et al., 2017) increases after metering completion (when the electricity connection is activated) but not earlier.

Figure A7: Engineering data collected (additional example sites)

Notes: These maps display the construction data collected at example sites. The grey line denotes 600 meters and the blue line denotes 700 meters from the transformer ('T') at the center. [Section 6](#) provides additional information on data collection. To preserve anonymity, random spatial noise has been added to household and business locations.

Figure A8: Two sites located less than 1,200 meters apart

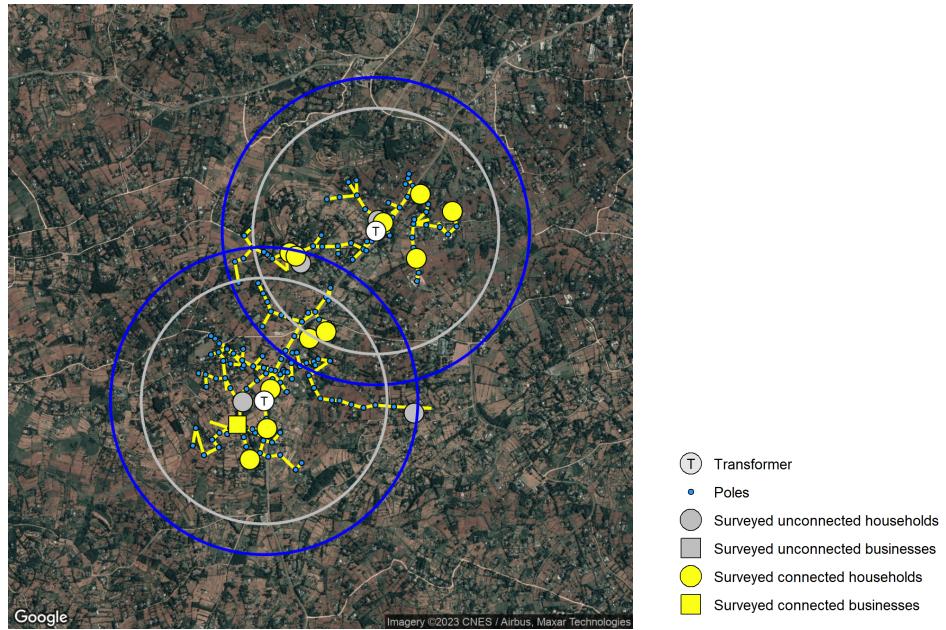

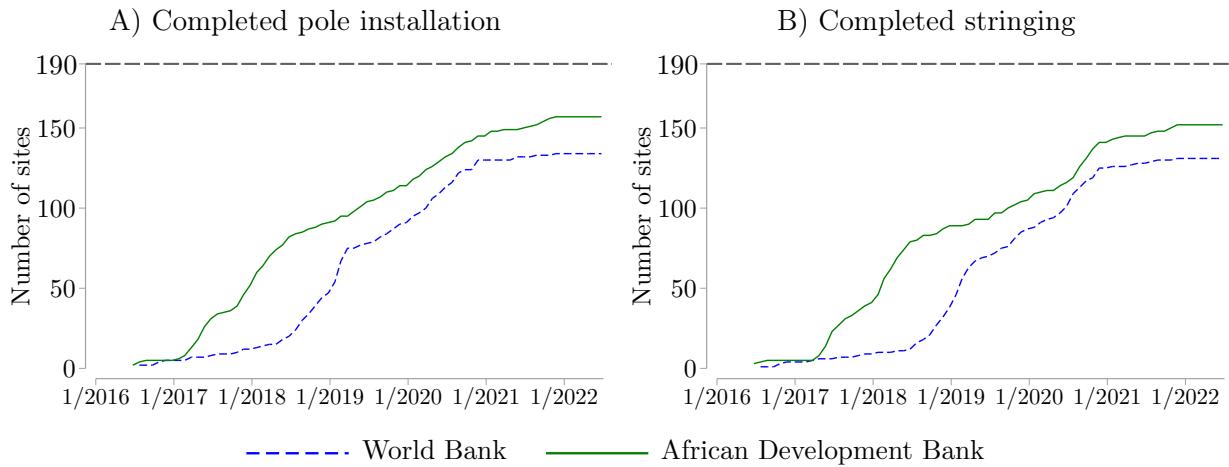

Figure A9: A PowerWatch device

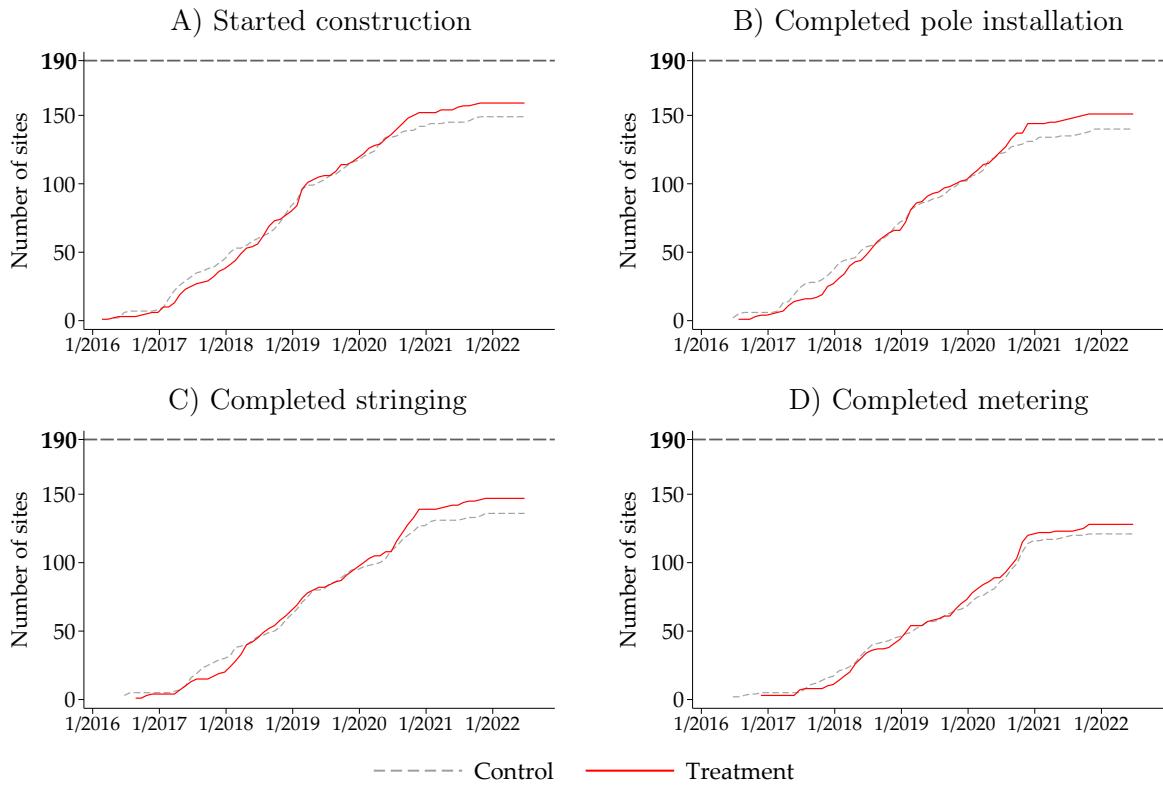

Notes: A PowerWatch device, part of nLine's GridWatch technologies used to measure household-level power outages and voltage. The device transmits data to the cloud in near real-time over the cellular network, and stores data locally to transmit later in the case of network failure. The GridWatch server consolidates data to detect patterns in power outages and reduce noisy signals.

Figure A10: Construction progress by funding source

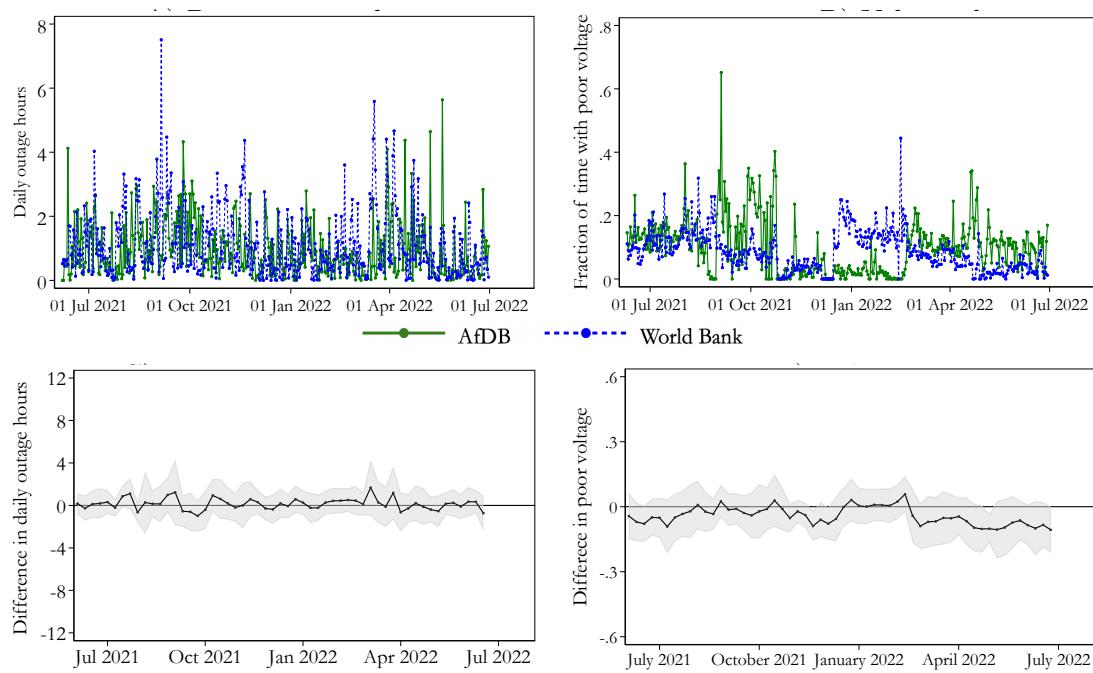

Notes: Data for 190 African Development Bank sites and 190 World Bank sites located in the five study counties collected through phone surveys with village representatives. [Figure 7](#) displays progress for pole installation and stringing.

Figure A11: Construction progress by audit treatment status

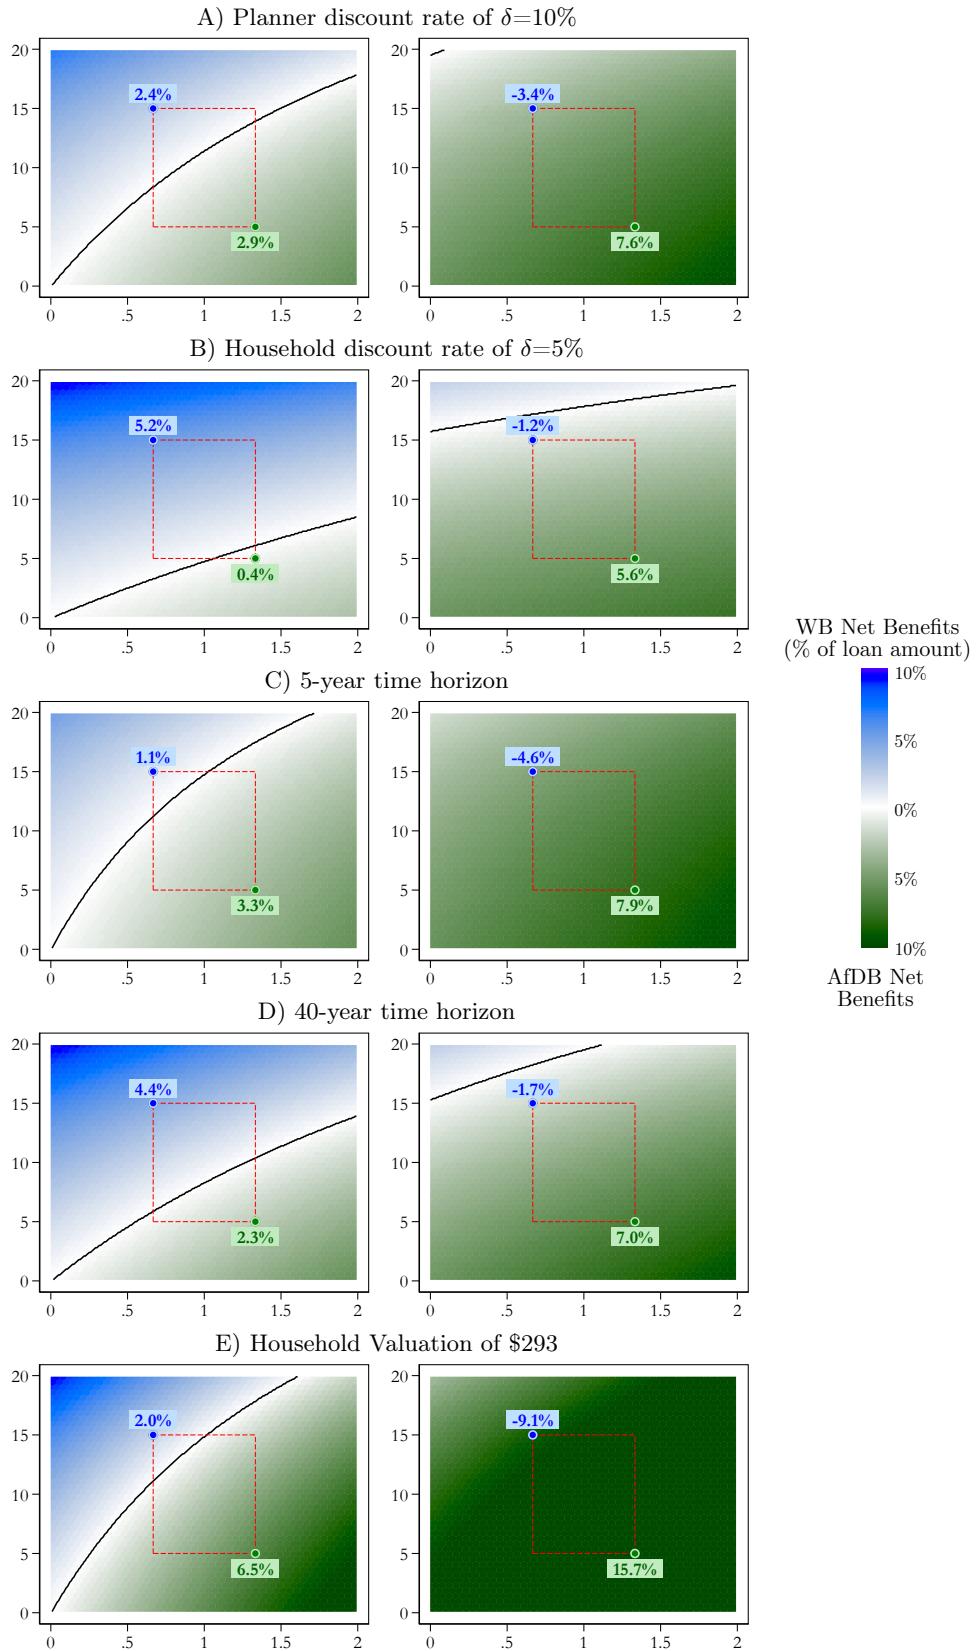

Notes: Data for 190 control sites and 190 treatment sites located in the five study counties collected through phone surveys with village representatives.

Figure A12: Reliability and voltage quality by funding source

Notes: Panels A and B present the hours of power outage per day and fraction of time experiencing poor voltage quality, respectively, for World Bank and African Development Bank sites. Panels C and D estimate a separate coefficient for each week of the sample, with constituency fixed effects and standard errors clustered by site. In the voltage graphs, periods with power outages are set to missing in the voltage measurement data, but the results look similar when coding such periods as having  $V = 0$ .

Figure A13: Costs versus benefits on various assumptions

Notes: Variations on the assumptions used for [Figure 8](#), which presents results using our preferred assumptions. Each sub-title indicates the one aspect that has been changed relative to [Figure 8](#).

## B Appendix Tables

Table A1: Geographic balance of World Bank- and African Development Bank-funded sites

	Road Distance	VIIRS Radiance	Land Gradient
	(1)	(2)	(4)
World Bank (=1)	1.17 (1.67)	0.01 (1.06)	0.02 (0.06)
Observations	366	366	19085
Month FE	No	No	Yes
Constituency FE	Yes	Yes	Yes
AfDB Mean	57.97	72.08	.24
Outcome variable	Minutes	KM	

Notes: Columns (1) and (2) estimate distance in driving minutes and in kilometers from each study site to the nearest ‘major town’ (WRI 2007; HERE (2022)). Column (3) estimates monthly average site-level nighttime radiance measured using VIIRS averaged across the 600 meter radius (Elvidge et al., 2017). SEs clustered by site (Figure 9 shows the time series). Column (4) estimates average site-level land gradient recorded using the 90-meter Shuttle Radar Topography Mission Global Digital Elevation Model. This table only includes observations from study sites (Table 2 includes all phase 1 sites). Month and constituency FE included where indicated. \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Table A2: Machine Learning methods to predict assignment of LMCP sites

Predictor	LPM LASSO Coefficient		Logit LASSO Coefficient		Decision Tree Importance

Notes: Most transformers were constructed between 2005-2015 as part of a push by Kenya's Rural Electrification Authority (REA) to electrify public facilities like schools, religious buildings and markets, and there appear to be some differences in the likelihood of transformers located near specific types of facilities to be assigned to one funder or the other. We test whether transformers connected to certain types of facilities were more or less likely to be assigned to WB or AfDB funding. Total shares can exceed 1 because some transformers are located near multiple public facilities. We test this separately using field data collected during our surveys, administrative data for our entire sample, and nationwide administrative data. All regressions include constituency fixed effects.

Table A4: Balance in 2009 census socioeconomic characteristics by number of LMCP sites per ward (five counties sample)

	Dep.	Var. [SD]	Mean	Percent of LMCP Sites that are WB-funded	N
<i>Panel A: 2009 Census</i>					
Age 14 or Under		51.39 [3.76]	-0.01 (0.01)	170	
Consumption		3063.59 [1285.98]	1.57 (3.00)	170

Joint F-test				p-value = .05	

Notes: This table tests for correlations between the share of Last Mile Connectivity Project (LMCP) sites in a ward allocated to World Bank (WB) funding and baseline characteristics, at the ward level, among wards with at least 1 study site. Table 8 shows a version testing balance among all LMCP sites nationwide. Panel A tests balance on characteristics from the 2009 national census. Row 1 shows population share aged 14 years or younger. Row 2 shows monthly consumption expenditures per capita in Kenya Shillings (Ksh). Rows 3 and 4 show primary and secondary school completion rates, respectively. Rows 5–8 show percentage of households with solar, electricity, a high wall and roof quality, respectively. Rows 8–9 show the total ward population and land area, respectively. Panel B tests balance on political and ethnic data. Row 10 show the percentage of the ward that voted for Kenyatta in the 2013 presidential election. Row 11 is a dummy variable equal to one if the ward voted for the same party as their constituency MP. Rows 12–14 are dummy variables showing political alignment with major ethnic groups, equal to one if the ward voted for a member of that ethnic group in the 2013 county assembly elections. All regressions include constituency fixed effects. Data sources: Kenya National Bureau of Statistics (2006; 2009). \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Notes: Differences between sites that saw construction and sites that did not, among the tracked sample of 378.

Table A8: Representative examples of contract language

World Bank	African Development Bank
<i>Additional evaluation criteria</i>	
[2.17 <sup>a</sup> ] The bidding documents shall specify any factors, in addition to price, which will be taken into account in evaluating bids, and how such factors will be quantified or otherwise evaluated. If bids based on alternative designs, materials, completion schedules, payment terms, etc. are permitted, conditions for their acceptability and the method of their evaluation shall be expressly stated.	[2.17 <sup>b</sup> ] The bidding documents shall specify any factors, in addition to price, which will be taken into account in evaluating bids, and how such factors will be quantified or otherwise evaluated. If bids based on alternative designs, materials, completion schedules, payment terms, etc., are permitted, conditions for their acceptability and the method of their evaluation shall be expressly stated. 2.17 for both, "a" source calculations
<i>Bidder cost</i>	<i>Bidder cost</i>
[2.21 <sup>a</sup> ] Bids for goods shall be invited on the basis of CIP (place of destination) for all goods manufactured abroad and to be imported. Bids for goods that were previously imported shall be invited on the basis of CIP (place of destination) separately indicating the actual amount of customs duties and import taxes already paid. Bids for goods manufactured in the Borrower's country shall be invited on the basis of EXW (ex works, ex factory, or off-the-shelf) plus cost of inland transportation and insurance to the place of destination. Bidders shall be allowed to arrange for ocean and other transportation and related insurance from any eligible source. Where installation, commissioning, or other similar services are required to be performed by the bidder, as in the case of supply and installation contracts, the bidder shall be required to quote for these services.	[2.21 <sup>b</sup> ] Bids for goods shall be invited on the basis of CIP (place of destination) for all goods manufactured abroad, including those previously imported, and EXW (Ex works, Ex factory, or Off-the-shelf) plus cost of inland transportation and insurance to the place of destination for goods manufactured or assembled in the country of the Borrower. Bidders shall be allowed to arrange for ocean and other transportation and related insurance from any eligible source. Where installation, commissioning, or other similar services are required to be performed by the bidder, as in the case of "supply and installation" contracts, the bidder shall be required to quote for these services, in addition.
<i>Schedule of payment</i>	
[2.34 <sup>a</sup> ] [...] (a) Contracts for supply of goods shall provide for full payment on the delivery and inspection, if so required, of the contracted goods except for contracts involving installation and commissioning, in which case a portion of the payment may be made after the Supplier has complied with all its obligations under the contract. The Bank normally requires the use of letters of credit so as to assure prompt payment to the Supplier. In major contracts for equipment and plant, provisions shall be made for suitable advances and, in contracts of long duration, for progress payments during the period of manufacture or assembly. (b) Contracts for works shall provide, in appropriate cases for mobilization advances, advances on Contractor's equipment and materials, regular progress payments, and reasonable retention amounts to be released upon compliance with the Contractor's obligations under contract.	[2.34 <sup>b</sup> ] [...] (a) Contracts for supply of goods shall provide for full payment on the delivery and inspection, if so required, of the contracted goods except for contracts involving installation and commissioning, in which case a portion of the payment may be made after the Supplier has complied with all its obligations under the contract. The use of letters of credit is encouraged so as to assure prompt payment to the supplier. In major contracts for equipment and plant, provision shall be made for suitable advances and, in contracts of long duration, for progress payments during the period of manufacture or assembly. (b) Contracts for works shall provide in appropriate cases for mobilization advances, advances on contractor's equipment and materials, regular progress payments, and reasonable retention amounts to be released upon compliance with the Contractor's obligations under contract.
<i>Bid securities</i>	
[2.39 <sup>a</sup> ] Contracts for works and single responsibility contracts shall require security in an amount sufficient to protect the Borrower in case of breach of contract by the Contractor. This security shall be provided in an appropriate form and amount, as specified by the Borrower in the bidding document. The amount of the security may vary, depending on the type of security furnished and on the nature and magnitude of the works or facilities. A portion of this security shall extend sufficiently beyond the date of completion of the works or facilities to cover the defects liability or maintenance period up to final acceptance by the Borrower. Contracts for works may provide for a percentage of each periodic payment to be held as retention money until final acceptance. Contractors may be allowed to replace retention money with an equivalent security in the form of a Bank security or guarantee after provisional acceptance.	[2.39 <sup>b</sup> ] Bidding documents for works shall require security in an amount sufficient to protect the Borrower in case of breach of contract by the Contractor. This security shall be provided in an appropriate form and amount, as specified by the Borrower in the bidding document. The amount of the security may vary, depending on the type of security furnished and on the nature and magnitude of the works. A portion of this security shall extend sufficiently beyond the date of completion of the works to cover the defects liability or maintenance period up to final acceptance by the Borrower; alternatively, contracts may provide for a percentage of each periodic payment to be held as retention money until final acceptance. Contractors may be allowed to replace retention money with an equivalent security after provisional acceptance.

<i>Bid evaluation and adjustment</i>	<i>Bid evaluation and adjustment</i>
[2.49-2.50 <sup>a</sup> ] The purpose of bid evaluation is to determine the cost to the Borrower of each bid in a manner that permits a comparison on the basis of their evaluated cost. Subject to paragraph 2.58, the bid with the lowest evaluated cost, but not necessarily the lowest submitted price, shall be selected for award. The bid price read out at the bid opening shall be adjusted to correct any arithmetical errors. Also, for the purpose of evaluation, adjustments shall be made for any quantifiable non-material deviations or reservations. Price adjustment provisions applying to the period of implementation of the contract shall not be taken into account in the evaluation.	[2.49-2.50 <sup>b</sup> ] The purpose of bid evaluation is to determine the cost to the Borrower of each bid in a manner that permits a comparison on the basis of their evaluated cost. Subject to paragraph 2.58, the bid with the lowest evaluated cost, but not necessarily the lowest submitted price, shall be selected for award. The bid price read out at the bid opening shall be adjusted to correct any arithmetical errors. Also, for the purpose of evaluation, adjustments shall be made for any quantifiable nonmaterial deviations or reservations. Price adjustment provisions applying to the period of implementation of the contract shall not be taken into account in the evaluation.
<i>Factors of bid evaluation</i>	<i>Factors of bid evaluation</i>
[2.52 <sup>a</sup> ] Bidding documents shall also specify the relevant factors in addition to price to be considered in bid evaluation and the manner in which they will be applied for the purpose of determining the lowest evaluated bid. For goods and equipment, other factors may be taken into consideration including, among others, payment schedule, delivery time, operating costs, efficiency and compatibility of the equipment, availability of service and spare parts, and related training, safety, and environmental benefits. The factors other than price to be used for determining the lowest evaluated bid shall be, to the extent practicable, expressed in monetary terms in the evaluation provisions in the bidding documents.	[2.52 <sup>b</sup> ] Bidding documents shall also specify the relevant factors in addition to price to be considered in bid evaluation and the manner in which they will be applied for the purpose of determining the lowest evaluated bid. For goods and equipment, other factors may be taken into consideration including, among others, payment schedule, delivery time, operating costs, efficiency and compatibility of the equipment, availability of service and spare parts, and related training, safety, and environmental benefits. The factors other than price to be used for determining the lowest evaluated bid shall, to the extent practicable, be expressed in monetary terms, or given a relative weight in the evaluation provisions in the bidding documents.
<i>Payment schedule</i>	<i>Payment schedule</i>
[7 <sup>e</sup> ] In respect of plant and equipment supplied from abroad, the following payments shall be made: Twenty percent (20%) of the total CIP amount as an advance payment against receipt of invoice and an irrevocable advance payment security for the equivalent amount made out in favor of the Employer. The advance payment security may be reduced in proportion to the value of the plant and equipment delivered to the site, as evidenced by shipping and delivery documents. Seventy percent (70%) through confirmed letter of Credit of the total or pro rata CIP amount upon Incoterm "CIP", upon delivery to the carrier within forty-five (45) days after receipt of documents. Five percent (5%) of the total or pro rata CIP amount upon issue of the Completion Certificate, within forty-five (45) days after receipt of invoice. Five percent (5%) of the total or pro rata CIP amount upon issue of the Operational Acceptance Certificate, within forty-five (45) days after receipt of invoice	[7 <sup>f</sup> ] In respect of plant and equipment supplied from abroad, the following payments shall be made: Twenty percent (20%) of the total CP amount as an advance payment against receipt of invoice and an irrevocable advance payment security for the equivalent amount made out in favor of the Employer. The advance payment security may be reduced in proportion to the value of the plant and equipment delivered to the site, as evidenced by shipping and delivery documents. Seventy percent (70%) of the total or pro rata CIP amount upon Incoterm "CIP", upon delivery to the carrier within sixty (60) days after receipt of documents [Employer to state the required documents, such as a negotiable bill of lading, a non-negotiable sea way bill, an airway bill, a railway consignment note, a road consignment note, insurance certificate, etc]. Five percent (5%) of the total or pro rata amount upon issue of the Completion Certificate, within forty-five (45) days after receipt of invoice. Five percent (5%) of the total or pro rata CIP amount upon issue of the Operational Acceptance Certificate, within sixty (60) days after receipt of invoice.
<i>Wood pole technical specifications</i>	<i>Wood pole technical specifications</i>
[4.1.4 <sup>g</sup> ] The poles shall be of sound wood, free from decay, insect attack, rot pockets and any damages caused by handling and processing that would affect the strength of the poles. Growth and seasoning defects (knots, spiral grain, end check, surface check and ring shakes) shall be limited to the requirements as set in KS 516:2008. Table A9: Construction quality

	(1)	(2)	(3)	(4)	(5)
	AfDB Mean	World Bank Effect Estimate ( $\beta_1$ )	Treatment Effect, WB Sites ( $\beta_2$ )	Treatment Effect, AfDB Sites ( $\beta_3$ )	N
Outcome 1: Construction quality index	0.00 [1.00]	0.64*** (0.21)	0.10 (0.20)	-0.03 (0.18)	250
* Transformer does not have bypassed fuse	0.40 [0.49]	-0.15* (0.08)	-0.05 (0.08)	-0.08 (0.08)	250
Pole does not have a crack $\geq$ 1cm	0.74 [0.44]	0.05 (0.03)	0.00 (0.03)	-0.01 (0.03)	21022
Pole leaning at $\geq$ 85 degrees	0.97 [0.16]	0.01* (0.00)	0.01* (0.00)	0.00 (0.00)	21229
Line has $\geq$ 0.5m horiz clearance	0.93 [0.25]	-0.03*** (0.01)	0.01 (0.01)	-0.02** (0.01)	19780
Pole has cap	0.28 [0.45]	0.33*** (0.04)	0.03 (0.04)	0.06 (0.04)	17900
Stay/strut properly installed	0.92 [0.27]	0.01 (0.02)	-0.01 (0.01)	0.00 (0.02)	3193
Stay/strut installed when required	0.79 [0.41]	0.16*** (0.03)	0.02 (0.02)	0.01 (0.04)	9811
Insulator properly installed	0.99 [0.10]	-0.02* (0.01)	0.00 (0.01)	-0.00 (0.01)	3076
Insulator installed when required	0.98 [0.13]	0.01* (0.01)	-0.01* (0.01)	0.01 (0.01)	3103
Pole has grounding wire	0.34 [0.47]	0.03** (0.01)	0.01 (0.01)	-0.02* (0.01)	21229

Notes: The construction quality index (shown here in row 1) is a standardized average of sub-components shown in the remaining rows. Transformer bypassed fuse is measured once at each site. All other outcomes are measured for all poles measured in the engineering assessment survey (described in Section 6). For each pole-level outcome, the sample is limited to poles for which that outcome can be assessed. Standard errors are clustered by site. An F-test of  $H_0 : \beta_1 - \beta_3 = 0$  for the metering completion date has a p-val < 0.001.  
 $* \leq 0.10, ** \leq .05, *** \leq .01$ .

Table A10: Network configuration

	(1)	(2)	(3)	(4)	(5)
	AfDB Mean	World Bank Effect Estimate ( $\beta_1$ )	Treatment Effect, WB Sites ( $\beta_2$ )	Treatment Effect, AfDB Sites ( $\beta_3$ )	N
Outcome 2: Network size and configuration index	0.00 [1.00]	-0.04 (0.16)	0.19 (0.16)	-0.08 (0.18)	244

Absolute Deviation in Drop Cables (relative to design)	62.12 [44.79]	15.69 (9.57)	-0.07 (9.49)	11.78 (10.49)	178
Fraction of compounds at site, within 100m of LV line, electrified	0.89 [0.13]	-0.02 (0.02)	0.04 (0.03)	-0.01 (0.02)	244
Fraction of poles $\leq$ 600m from transformer	0.95 [0.08]	0.02 (0.01)	0.01 (0.01)	0.00 (0.01)	244
Number of poles in design	134.51 [87.55]	-1.10 (15.32)	-8.89 (16.60)	12.52 (15.92)	197

Notes: The network size and configuration index (shown here in row 1) is a standardized average of sub-components shown in the remaining rows. All outcomes are measured at the site level. Compound data is collected in the household and firm survey data (described in Section 6). Pole data is collected in the engineering assessment survey (described in Section 6). \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Table A11: Household installation quality

	(1)	(2)	(3)	(4)	(5)
	AfDB Mean	World Bank Effect Estimate ( $\beta_1$ )	Treatment Effect, WB Sites ( $\beta_2$ )	Treatment Effect, AfDB Sites ( $\beta_3$ )	N
Outcome 4: Household installation quality index	-0.00 [1.01]	0.05 (0.12)	0.02 (0.11)	0.23* (0.12)	944
Outcome 4 (omitting readyboard question)	-0.01 [1.00]	0.15 (0.12)	-0.03 (0.12)	0.23* (0.12)	944
Electricity has flowed to this household (=1)	0.81 [0.39]	0.05 (0.06)	0.04 (0.04)	0.08 (0.05)	944
Household has $\geq 1$ meter (=1)	0.86 [0.35]	0.09** (0.04)	0.01 (0.04)	0.08* (0.04)	944
Household has meter that has worked (=1)	0.77 [0.42]	0.06 (0.06)	0.07 (0.05)	0.11** (0.05)	943
Household has a readyboard (=1)	0.26 [0.44]	-0.14*** (0.04)	0.08** (0.04)	0.02 (0.05)	944
(-) Number of unrequested meters (of hhs w/ meter)	0.51 [0.50]	-0.04 (0.07)	0.10* (0.06)	0.09 (0.06)	713
(-) Weeks from paperwork to receiving meter (of hhs w/ meter)	13.64 [25.10]	4.32 (2.95)	1.58 (2.32)	-2.09 (2.47)	884
(-) Weeks from meter to receiving electricity (of hhs with elec)	2.43 [4.12]	-0.26 (0.44)	0.93* (0.54)	-0.82* (0.46)	761

Notes: The household installation quality index (shown here in rows 1 and 2) is a standardized average of sub-components shown in the remaining rows. Row 2 omits the ready board question as the absence of a ready board is not strictly an indication of poor quality. All outcomes are measured at the household level and collected in the household and firm survey data (described in Section 6). For outcomes marked with a (-), a higher value indicates a lower quality. For all other outcomes, a higher value indicates higher quality.  
\*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Table A12: Household cost, experience, and bribery

	(1)	(2)	(3)	(4)	(5)

Notes: The firm performance index (shown here in row 1) is a standardized average of sub-components shown in the remaining rows. All outcomes are measured at the firm level and collected in the household and firm survey data (described in Section 6). \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Table A18: Household Political and Social Beliefs

	(1)	(2)	(3)	(4)	(5)
	AfDB Mean	World Bank Effect Estimate ( $\beta_1$ )	Treatment Effect, WB Sites ( $\beta_2$ )	Treatment Effect, AfDB Sites ( $\beta_3$ )	N
Outcome 11: Political and Social Beliefs index	0.00 [0.99]	0.03 (0.08)	0.01 (0.08)	0.03 (0.09)	944
HH electrification in top 2 most-important govt policies (=1)	0.21 [0.41]	0.00 (0.04)	-0.01 (0.04)	-0.01 (0.04)	944
Thinks govt doing good job providing electricity (=1)	0.98 [0.14]	0.00 (0.01)	-0.00 (0.01)	-0.01 (0.01)	944
Voted in August 2017 election (=1)	1.15 [4.42]	0.07 (0.20)	0.35 (0.33)	0.48 (0.35)	944

Notes: The household political and social beliefs index (shown here in row 1) is a standardized average of sub-components shown in the remaining rows. All outcomes are measured at the household or firm level and collected in the household and firm survey data (described in Section 6). \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Table A19: Impact of gradient and facility type on construction delays

*Panel A) Months to stringing completion*

	(1)	(2)	(3)	(4)	(5)
World Bank (=1)	6.8*** (2.1)	9.9*** (2.2)	9.5*** (2.3)	9.5*** (2.3)	8.7*** (2.5)
Land gradient			0.6 (0.6)		0.4 (0.7)
Health center				-0.3 (5.4)	1.1 (5.7)
Secondary school				-0.4 (3.3)	-1.3 (3.4)
Primary school				1.8 (2.4)	2.6 (2.6)
Market center				1.1 (2.7)	1.9 (2.9)
Religious building				-3.9 (2.9)	-4.0 (3.0)
Other				2.7 (5.8)	4.9 (6.3)
Observations	246	246	229	226	211
Constituency FE	No	Yes	Yes	Yes	Yes

*Panel B) Months to metering completion*

	(1)	(2)	(3)	(4)	(5)
World Bank (=1)	9.6*** (1.8)	12.4*** (1.8)	11.7*** (1.9)	13.2*** (1.9)	12.2*** (2.0)
Land gradient			1.0* (0.5)		0.8 (0.6)
Health center				3.7 (4.5)	5.3 (4.6)
Secondary school				0.9 (2.7)	0.4 (2.7)
Primary school				1.3 (2.0)	1.6 (2.1)
Market center				-2.0 (2.2)	-1.1 (2.3)
Religious building				1.4 (2.4)	1.3 (2.5)
Other				3.8 (4.7)	6.5 (5.1)
Observations	248	248	231	227	212
Constituency FE	No	Yes	Yes	Yes	Yes

Notes: Stringing (metering) was completed at WB sites on average 6.8 (9.6) months later than at AfDB sites when pooling audit control and treatment sites. Controlling for land gradient and facility type does not affect these estimates meaningfully, and land gradient and facility type appear largely uncorrelated with time to stringing and metering completion. \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Table A20: Heterogeneity in WB delay by facility type

	Time to stringing completion (months)				
	(1)	(2)	(3)	(4)	(5)
World Bank (=1)	18.5 (13.5)	5.2 (6.9)	8.8* (5.0)	-6.0 (5.3)	-3.0 (14.6)
Observations	9	64	53	17	21
Control Mean	41.5	53.16	50.52	43.1	54.36
Sample	Health centers	Schools	Market centers	Religious buildings	Others

Notes: While there are small differences between funder type in the facility type associated with each transformer ([Table A3](#)) this does not drive heterogeneity in the impact of WB conditionality on construction delays when compared with AfDB sites. \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

Table A21: Primary engineering and socioeconomic outcomes excluding Lots 3 and 5

	(1) WB Effect Estimate $(\beta_1)$	(2) Audit Treatment Effect, WB Sites $(\beta_2)$	(3) Audit Treatment Effect, AfDB Sites $(\beta_3)$	(4) N
Outcome 1: Construction quality index	0.57 (0.50)	0.13 (0.49)	0.05 (0.19)	161
Outcome 2: Network size and configuration index	0.66 (0.40)	-0.16 (0.37)	-0.07 (0.20)	156
Outcome 3: Construction timing index	-1.13*** (0.38)	-0.15 (0.39)	-0.36** (0.17)	161
Outcome 4: Household installation quality index	-0.55** (0.26)	0.79*** (0.23)	0.23* (0.13)	592
Outcome 5: Household cost, experience, bribery index	0.39** (0.19)	0.11 (0.18)	0.11 (0.10)	592
Outcome 6: Reliability and safety index	-0.12 (0.16)	-0.18 (0.17)	-0.08 (0.10)	592

Treated x ManyTreated		0.07 (0.13)	
Outcome 8: Electricity Usage index			
Treated		0.32*** (0.11)	
Treated x ManyTreated		-0.19 (0.12)	

Test for null hypothesis of equal treatment effects for all outcomes: p=0.252

Notes: This table tests whether audit treatment effects differ across contractors that had a higher percentage of their sites in the treatment group. Outcome variables are indices constructed from groups of variables standardized to have mean 0 and standard deviation 1. "Treated" is a binary variable that equals 1 if the occupant is at a treated site. "ManyTreated" is a binary variable if the occupant's site is assigned to the contractor with the highest percentage of sites in the audit treatment group for its funder. All equations include constituency fixed effects, funder fixed effects, census controls, and land gradient and public facility type controls (given some baseline imbalance along these dimensions) and were jointly estimated using seemingly unrelated regression. Standard errors are clustered by site and shown in parentheses. \*  $\leq 0.10$ , \*\*  $\leq .05$ , \*\*\*  $\leq .01$ .

## C Conceptual framework

To illustrate how the degree of contract bundling and the extent of monitoring can affect outcomes, we present a simple framework through which to analyze these contracting structures. To fix ideas, assume the principal wants the three components (designs, supplies, and installation) to be carried out by firms selected from a continuum of firms  $\gamma_i \in [0, \infty)$  defined by firm type, where higher types produce higher quality at higher cost. Firms are selected through a competitive auction, and only firms exceeding an exogenously set firm type threshold  $\bar{\gamma}$  are eligible to bid (in our setting, bidders must meet uniform global WB and AfDB documentation requirements).<sup>20</sup> Each firm also chooses how much effort  $e_i \in [0, \infty)$  to exert. The quality of each component is determined by the firm type and the effort that firm exerts:  $q_i = \gamma_i + e_i$ . Overall project quality is the sum of the three components:  $Q = q_a + q_b + q_c$ .

Increasing firm type  $\gamma_i$  incurs convex cost  $c(\gamma_i)$ . A firm exerting effort  $e_i$  incurs convex cost  $d(e_i)$ , with  $d'(0) = 0$  and  $d(0) = 0$ . For a given level of quality  $q$ , denote  $\gamma^*(q)$  and  $e^*(q)$  to be the cost-minimizing combination of effort and firm type, with  $\gamma^* > \bar{\gamma}$ . We assume perfect competition, with firms bidding to cover their costs,  $b_i = c(\gamma_i) + d(e_i)$  (a reasonable approximation in our context, where most auctions attract a large number of bids from many local and international firms).

The principal faces two problems. First, it has imperfect information about firm types, and can only observe whether a firm exceeds the minimum threshold (installers, on the other hand, have perfect information about designer and supplier types<sup>21</sup>). Second, since firms decide how much effort to exert after contracts have been awarded, the principal must find a way to incentivize effort.

The principal has two contracting tools. First, it can choose to offer either one bundled contract ( $t = 1$ ) or three unbundled contracts ( $t = 3$ ). Second, the principal can implement either low ( $m = L$ ) or high ( $m = H$ ) monitoring. Under low monitoring, all contractors are paid regardless of realized quality. In this case, firms exert no effort, and quality simply corresponds to their firm type:  $q_i = \gamma_i$ . Under high monitoring, contractors are only paid if the quality of the component(s) included in their contract meets a quality threshold  $\bar{q}$ . If any component is produced below output quality  $\bar{q}$ , then the contracted firm is not paid. The principal implements the auction as follows, where P and A denote decisions taken by the Principal and Agent (firms), respectively:

- (P1) The principal sets the auction parameters ( $t$  and  $m$ ). For unbundled contracts, the principal runs three sequential auctions. For bundled contracts, the principal runs one auction for installation.
- (A1) Each eligible firm decides whether or not to bid. If it chooses to bid, it then chooses a bid amount  $b_i$ .
- (P2) The principal identifies the lowest eligible bid as the winner of each auction.

---

<sup>20</sup>An alternative model could endogenize this threshold: lower monitoring or contract unbundling might change the optimal threshold. We omit that here as the threshold is exogenously set by donor policy in this context.

<sup>21</sup>Conducting installation using another firm's designs and supplies provides a level of insight into that firm's type and effort that cannot be achieved by the principal through even very careful monitoring. Furthermore, in practice many installers collaborate with the same designer or supplier much more frequently than the principal does.

- If the contracts are unbundled, the principal awards three contracts.
- If the contract is bundled, the principal awards one contract for installation. The winner then selects a designer  $\gamma_a \in [0, \infty)$  and a supplier  $\gamma_b \in [0, \infty)$  with full discretion (they can choose firms below the threshold:  $\gamma_i < \bar{\gamma}$ ). The installer can mandate their effort levels  $e_a$  and  $e_b$ .

(A2) Each firm chooses an effort level  $e_i$  and realizes their output quality  $q_i$ .

(P3) The principal pays the contractor(s) (or not).

- If  $m = L$ , all firms are paid regardless of  $q_i$ .
- If  $m = H$  and  $t = 1$ , all firms are paid only if  $q \geq \bar{q}$  for each component (and the installer pays the designer and supplier *iff* it is paid).
- If  $m = H$  and  $t = 3$ , the designer, supplier, and installer are each paid only if their respective output quality is at least  $\bar{q}$ .

Assuming perfect competition, firms bid to cover their costs:

- If  $t = 1$ , the firm's bid is  $b_c = c(\gamma_a) + d(e_a) + c(\gamma_b) + d(e_b) + c(\gamma_c) + d(e_c)$ . The firm pays the design firm  $c(\gamma_a) + d(e_a)$  and the supplies firm  $c(\gamma_b) + d(e_b)$ .
- If  $t = 3$ , each firm's bid is  $b_i = c(\gamma_i) + d(e_i)$ .

Case 1 ( $t = 3, m = L$ ):

- Firms with  $\gamma_i = \bar{\gamma}$  will bid  $c(\bar{\gamma})$  and win all three auctions.
- There is no incentive to supply any effort, so  $e_i = 0$
- Project quality will be  $3\bar{\gamma}$ , with cost per contract  $b(3, L) = c(\bar{\gamma})$  and total cost  $3c(\bar{\gamma})$

Case 2 ( $t = 3, m = H$ ):

- For each component, the winning firm is the one that can produce output quality  $\bar{q}$  at lowest cost, since no other firm can bid lower than them while achieving at least zero profit. The winning firms will each have type  $\gamma_i$  and choose  $e_i$  such that:  $c'(\gamma_i) = d'(e_i)$ . Let  $\gamma^*$  and  $e^*$  be the solution to this problem.
- Project quality will be  $\bar{q}$ , with cost per contract  $b(3, H) = c(\gamma^*) + d(e^*)$  and total cost of  $3c(\gamma^*) + 3d(e^*)$ .

Case 3 ( $t = 1, m = L$ ):

- The winning firm has  $\gamma = \bar{\gamma}$  and bids  $c(\bar{\gamma}) + 2c(0)$  in the auction. It is the firm of at least type  $\bar{\gamma}$  that can bid the lowest. It then exerts no effort.
- For design and materials, it has no incentive to select firms with more than minimum firm type, and it will contract assuming zero effort from those firms.
- Project quality will be  $\bar{\gamma}$ , with total cost  $b(1, L) = c(\bar{\gamma}) + 2c(0)$ .

Case 4 ( $t = 1, m = H$ ):

- With full ability to contract on firm type and effort exerted, the winning firm will wish to supply output quality  $\bar{q}$  at minimum cost. The winning firm that is able to bid the lowest will have  $\gamma_c^*$  and choose effort level  $e_c^*$ ; and will seek to contract design and materials firms with type and levels of effort  $\gamma_a^*, e_a^*, \gamma_b^*, e_b^*$  such that:  $c'(\gamma_a) = d'(e_a) = c'(\gamma_b) = d'(e_b) = c'(\gamma_c) = d'(e_c)$ .
- Project quality will be  $\bar{q}$ , with total cost  $b(1, H) = 3c(\gamma^*) + 3d(e^*)$ .

Contractors often also look to bid on future donor-funded projects as well, and under-performance or fraud can lead to sanctions that make them ineligible for future projects. Therefore one could also conceptualize equilibrium in this setting as a repeated game, where each round is played as described above, and each player pursues a grim trigger strategy.

While unbundling and higher monitoring may improve quality, they incur administrative costs  $\kappa(m, t)$ , which are increasing in both arguments. Furthermore, monitoring incurs delays both directly (the monitoring itself takes time) and indirectly (incurring greater effort may cause firms to complete activities more slowly), and unbundling causes delays by adding administrative and coordination tasks associated with conducting three sequential sets of auctions rather than a single set of auctions. These delays lower the project's future welfare gains  $W$  according to a function  $D(m, t, \delta) < 1$ , where  $\delta$  denotes the principal's intertemporal discount rate. When selecting  $t$  and  $m$  the principal wishes to maximize net benefits, factoring in these costs and delays, contract costs  $b_i$ , and long-term maintenance costs  $M$ , which decrease with aggregate project quality  $Q$  (the sum of the qualities of the three components:  $Q = q_a + q_b + q_c$ ). Maintenance costs can be thought of as the expenses needed to maintain project benefits at level  $W$  over the lifetime of the project (from year  $y = 1$  to  $Y$ ); higher quality construction lowers these expenses.

$$\text{Project Net Benefits} = D(m, t, \delta)W - \underbrace{\kappa(m, t)}_{\text{Welfare gains}} - \underbrace{\sum_{i=1}^t b_i(m, t)}_{\text{Administrative costs}} - \underbrace{\sum_{y=1}^Y \delta^y M(Q(m, t))}_{\text{Contract costs Long-term maintenance costs}} \quad (2)$$

The principal's optimal choice of monitoring and (un)bundling will depend on, for example, the delays incurred, their discount rate, and the effect of quality on long-term maintenance costs.

## D Additional analyses

### D.1 Jaccard and Embedding similarities

To more rigorously evaluate similarities across the documentation, we use two standard text comparison measures: Jaccard similarity and Embedding similarity. Jaccard similarity is a purely lexical comparison of words that makes no attempt to interpret meaning and we therefore interpret it as a more conservative measure of similarity. It is calculated by dividing the number of unique words shared by both texts by the total number of unique words appearing in either text. To allow for differences in exact word choice, we use OpenAI’s embedding model `text-embedding-3-large` to calculate Embedding scores. This captures similarities in semantic content outside of variations in wording or syntax. As examples, the sentences “Any additional information clarification correction of errors or modifications of bidding documents shall be sent to each recipient of the original bidding documents in sufficient time before the deadline for receipt of bids to enable bidders to take appropriate actions” (from AfDB 2012) and “All modifications of bidding documents information clarifications and corrections of errors shall be sent to each recipient of the original bidding documents and all bidders on record in sufficient time before the deadline for receipt of bids to enable bidders to take appropriate actions” (from WB 2014) have a Jaccard similarity of 0.71 and an Embedding similarity of 0.93. For reference, [Table A24](#) (shown below) provides some additional examples of sentences with their corresponding Jaccard and Embedding scores.

#### D.1.1 Jaccard scores

Jaccard similarity captures overlap in word usage without regard to semantic meaning. Specifically, the Jaccard score is the ratio of unique words that appear in both texts to unique words that appear in at least one text. Mathematically, the Jaccard score of sentences  $S_1$  and  $S_2$  is defined as:

$$\frac{\text{Words in } S_1 \cap \text{Words in } S_2}{\text{Words in } S_1 \cup \text{Words in } S_2}$$

Consider the following simple example comparing the sentences ‘Data is the new oil of the digital economy’ and ‘Data is a new oil’ (source: Study Machine Learning, 2025):

$$\begin{aligned} & \frac{\{\text{data, is, new, oil}\}}{\{\text{a, data, digital, economy, is, new, of, oil, the}\}} \\ & = \frac{4}{9} = 0.44 \end{aligned}$$

Since the number of sentences in most sections of the WB regulations is higher than in the AFDB regulations, we compare each AFDB sentence with all WB sentences in the same section and then calculate the percentage of AFDB sentences that have at least one WB sentence with a Jaccard Similarity greater than 0.8. This is the percentage reported in [Table 1](#).

There are several reasons why we chose to use this methodology rather than compute an aggregate Jaccard similarity across the entire text. First, Jaccard similarity only measures exact word overlap—when texts get longer, two completely different articles can be written using nearly the same set of words. The longer the text, the more likely two highly structured documents on the same topic will converge toward a common set of words regardless of the documents’ actual meaning. This is why narrowing the comparison scope (e.g., within sentences) can sometimes be more informative. Second, the two texts contain many sentences without direct counterparts—some are present in WB but not in AfDB, and vice versa. Since the WB text generally has more sentences than the AfDB text, this could dilute the Jaccard similarity. For example, if the AfDB text is a

direct excerpt from WB text but the WB text contains many additional sentences, the denominator increases, and so Jaccard similarity may not capture the degree to which the texts are aligned word-for-word. Of course, sentences without direct counterparts could well result in differences in meaning; Embedding similarity described in the next subsection is well-suited to measure such differences.

### D.1.2 Embedding similarities

“Embedding” is a natural language processing (NLP) term that refers to mapping text to a vector of floating-point numbers. This process not only measures word overlap but also captures syntactic and semantic properties. This is how ChatGPT, for example, can understand what people say.

We use OpenAI’s embedding model `text-embedding-3-large` to calculate Embedding scores. This method represents the semantic and syntactic properties of each text as a 3,072-dimensional vector of numbers. We then compute the Cosine similarity to measure the distance between the embeddings of the two documents, where 1 indicates identical vectors and 0 indicates no correlation.

Text analysis using Embedding similarities is more meaningful at the paragraph level, as mapping a small number of words into a 3000-dimensional vector results in high sparsity, making the computed similarity less reliable. This is why [Table 1](#) reports the aggregate Embedding similarity for specific sections rather than computing scores at the sentence level, as is the case with the Jaccard scores.

Due to a cap on the maximum text length, it was not possible to compute an Embedding similarity score for all sections combined. OpenAI’s embedding model can process approximately 7,000 words (8,191 tokens) in a single input. If the text is longer, it needs to be summarized or compressed before embedding. Since the WB and AfDB regulation have sections with clear counterparts, we report an aggregate embedding score that is an average of the scores for each section.

## D.2 Additional robustness tests

We begin by assessing potential endogeneity concerns related to the assignment mechanism raised in [Subsection 4.1](#). First, WB-funded sites have a 13% higher average land gradient. It is plausible that hilliness slows construction and that this difference explains the WB delays. We therefore examine whether land gradient has caused any of the difference in construction delays by funder assignment. Land gradient is uncorrelated with construction delays, both unconditionally and conditional on funder: the WB delays persist in a stable manner when controlling for land gradient ([Table A19](#)). Furthermore, lag between WB and AfDB is approximately constant across the entire land gradient support ([Figure 10](#)). The difference in land gradient is therefore unlikely to explain the results. Second, WB sites are significantly less likely to be located near a secondary school or religious building, and more likely to be located near a market center or no public facility at all ([Table A3](#)). The gap in timing between WB and AfDB sites is not significantly different across facility types ([Table A20](#)), and the gap in timing between WB and AfDB sites persists when controlling for facility type ([Table A19](#)). All results in [Table 5](#) control for facility type, which do not qualitatively affect the results. Evaluated together, these analyses make it unlikely that baseline differences in facility type contribute meaningfully to the results.

The GridWatch devices recorded data between June 2021 and June 2022, even though stringing at most AfDB sites was completed between 2017 and 2019 and stringing at most WB sites was completed between 2018 and 2020. Thus, the GridWatch data measured WB sites when they were on average one year newer than the AfDB sites surveyed at the same time. If the aging of the

grid negatively affects reliability and voltage quality, then this bias would favor WB in the results. [Figure A14](#) confirms that voltage quality is constant over time, and that the lack of difference in voltage quality between the WB and the AfDB persists even among sites where the time since stringing completion was approximately equal.

For Outcome 4 measuring household installation quality ([Table A11](#)) we replicate the index omitting the question asking the respondent whether they have a ready board, since it is not obvious whether the presence of a ready board is a positive or negative component. Its presence simultaneously indicates Kenya Power provisions and a lack of household preparedness (see [Subsection 2.2](#) for more detail).

Of the 250 sites that we surveyed, 26 are located less than 1,200 meters from another site. Given that AfDB sites saw construction on average earlier than WB sites, this could reduce construction at WB sites, as the subset of that site's unconnected households that lie within the 600 meter radius of the nearby site might already have been connected. This could explain why [Table 3](#) indicates less construction at WB sites. To test this, we replicate this table excluding the 26 sites—12 AfDB and 14 WB—that are within 1,200 of another site. [Table A22](#) shows the results. If anything, the gap between construction at WB and AfDB sites is even larger.

Finally, the private contractor awarded lots 3 and 5 of the WB construction contracts<sup>22</sup> experienced unusual financial circumstances and this may have interfered with the timeliness and quality of their construction. We therefore repeat the analysis from [Table 5](#) excluding these contracts, and then only keeping a balanced panel of counties. This does not affect results: if anything, household installation quality and reliability and safety were slightly worse at the remaining WB sites, although the results are noisier ([Table A21](#)).

### D.3 Long-term resilience of the grid

Construction might affect resilience through two key engineering channels. First, voltage quality tends to worsen with distance from the central transformer.<sup>23</sup> We find that this is primarily due to the increasing number of customers connected more closely to the transformer rather than the distance traveled along the LV electricity wire per se. [Table A25](#) shows no difference between funders in distance resilience.

Panel A of [Figure A14](#) explores the correlation between 10th percentile of voltage quality and distance to the transformer along the LV network.<sup>24</sup> There does not appear to be a significant or discontinuous decline after 600 meters, the eligibility cutoff for a subsidized LMCP household connection, suggesting greater returns to scale might have been achieved under a higher distance eligibility cutoff.

Second, voltage quality could worsen with the passage of time, as infrastructure ages. Higher quality construction might make infrastructure more resilient and slow any associated decay. The time since construction varies across our sample since stringing was completed between June 2017 and January 2021, while GridWatch devices recorded data between June 2021 and June 2022. Panel B of [Figure A14](#) examines the correlation between voltage quality and time since construction. At both AfDB and WB sites, the grid appears resilient to aging for the first five years after the completion of stringing.

---

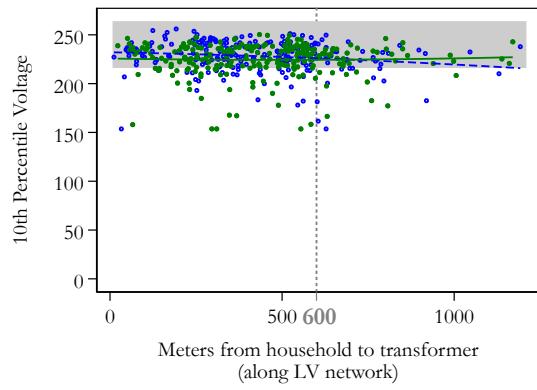

<sup>22</sup>A single consortium won both of these contracts.

<sup>23</sup>Jacome et al. (2019) find a similar result in Zanzibar, Tanzania.

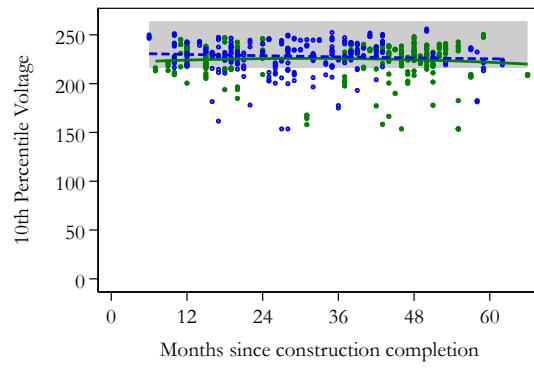

<sup>24</sup>The results look similar when using mean voltage. Using the 10th percentile of voltage quality is in line with engineering expectations around how resilience might affect voltage quality.

Figure A14: Voltage quality resilience to distance and infrastructure aging

A) Distance along LV network

B) Time since construction

Notes: 10th percentile of hourly voltage readings with quadratic fit line. The gray area indicates Kenya's nominal voltage, 240 V,  $\pm 10\%$  as per international utility guidelines. Panel A explores how a household's distance to the central transformer (as measured along the LV network) affects voltage quality. Panel B explores how the passage of time since the initial completion of construction affects voltage quality. Neither appear to strongly affect voltage quality. WB and AfDB exhibit similar trends.

## E Additional background information

### E.1 List of individuals engaged in qualitative interviews

Qualitative research included detailed in-person (or on Zoom, where required due to Covid-19) conversations with key leadership personnel at Kenya Power, World Bank, African Development Bank, and the Consultant charged with supervising construction. An asterisk (\*) indicates that a single position was held by different individuals at different points in time.

- World Bank employees:
  - Practice manager, Global energy and extractives practice, Africa region
  - Senior energy specialist, Kenya country team
  - Energy finance specialist, Kenya country team
- African Development Bank employees:
  - Principal power engineer\*
  - Principal power engineer\*
- Kenya Power employees:
  - General manager of connectivity
  - General manager of infrastructure development
  - LMCP Contract Project Manager (AfDB Phase I)
  - LMCP Project Leader (AfDB Phase I)
  - LMCP Contract Project Manager (WB)
  - LMCP Project Leader (WB)
  - LMCP Project Leader for (AfDB Phase II)
- Project Management Consultant employees:
  - Senior Manager

### E.2 Rural electrification in Kenya

In 2014, Kenya's Ministry of Energy and Petroleum (MoE) published the Draft National Energy Policy, establishing a list of policies and strategies to “increase rural electrification connectivity to at least 40% by 2016 and 100% by 2020” and to “seek funding from development partners for specific programmes especially...in rural electrification projects.” (MoE 2014). In Kenya Power’s 2014-2015 annual report, they note that “The KShs 4 Billion receivable from the GoK is part of a larger commitment by the GoK, to be financed partly through support from the World Bank and the African Development Bank to enhance universal access to electricity.” In May 2015, Kenya’s President Uhuru Kenyatta announced the launch of the LMCP, with a goal of connecting “one million new customers to electricity each year” (Kenya Presidency, 2015). In a press conference two weeks after President Kenyatta’s announcement, Kenya Power’s then- Managing Director Ben Chumo added that the program was designed to facilitate “the government’s objective of providing 70% households with electricity by 2017 and universal access by 2020” (Kenya Power, 2015c).<sup>25</sup> While not quite reaching these ambitious targets, the program has been effective: nationwide household electricity access was reported to have increased from 25% in 2009 to 70% in 2019 (KNBS 2009, 2019). Many of the rural transformers selected for the LMCP had been constructed between 2005 and 2013 as part of a nationwide push by Kenya’s then- Rural Electrification Authority (REA)<sup>26</sup> to connect all

<sup>25</sup>This target date was later extended to 2022, which was also not met.

<sup>26</sup>Since renamed Rural Electrification and Renewable Energy Corporation (REREC).

public facilities—such as markets, schools, health centers, and water points—to electricity (REA 2008, Berkouwer, Lee, and Walker, 2018).

In November 2017 the AfDB signed 15 additional turn-key contracts to begin maximization of an additional 5,200 sites as part of its *Phase II* (which we do not examine in this study).

### E.3 Upfront connection costs

Beneficiaries under the LMCP are connected via ‘pre-paid’ meters, meaning they must buy electricity credits in advance of using electricity. Once they consume all of their prepaid electricity, they lose access to electricity, and only regain access only after they buy more credits. Households usually prevent this by purchasing additional credits before their credits run out.

To recover the \$150 connection fee, Kenya Power initially enrolled households into a payment plan consisting of 36 monthly installments of around \$4 per month. The charge was automatically added to households’ accounts on a monthly basis, and any electricity payments the household made were directed towards paying off this debt prior to being directed towards electricity credits. However, this generated a significant barrier for households: as an example, if a household runs out of electricity credit in January, and then does not consume any electricity in February or March, they would have to pay at least \$16.01—4 months worth of connection fees—to be able to consume any electricity in April. The contribution was thus later capped at 50% of any topup amount (Kassem, Zane, and Uzor, 2022).

This barrier was not only a significant financial hurdle, but one that was unanticipated and poorly understood. According to Kenya Power, households should have been informed of the payment structure as part of the consent process, which was the very first step in the construction process, but it is unclear whether this consent process was regularly implemented in practice. To verify whether this process was correctly implemented, and to test whether donor conditionality and monitoring can improve adherence to these guidelines, the household survey (described in Section 6) measures respondent understanding of the aggregate costs of an electricity connection under the LMCP. 58% of households do not recall ever having been told that they would have to pay Kenya Power for the connection.

An additional financial hurdle was the upfront cost of wiring, which the LMCP later tried to address by providing ready boards. In a May 2015 address, President Kenyatta described this policy as follows: “*The Ministry of Energy has also come up with designs that will enable households that do not have internal wiring in their houses to use electricity by providing a ‘ready board’... [it] has switches, sockets and bulb holders and those who do not have wiring in their houses will be able to use electricity as soon as they are connected*” (Kenya Presidency, 2015).

### E.4 Informal and illegal connections

Illegal connections are much more common in urban areas than they are in rural areas like the villages where the LMCP was implemented. Many households in urban contexts, especially those living in informal settlement areas, are sufficiently close to the existing grid that they can be connected via a simple drop cable, which can usually be done by a local handyman at relatively low cost. Given the low population density in rural areas, connection of an additional household usually requires constructing at least one additional electricity pole, which requires more sophisticated engineering techniques. In our survey, only 2.7% of households with a working electricity connection did not have a meter. Of these, 93% said they had not been metered yet but would be metered soon, and 20% said they had not yet done the internal wiring that was required prior to connection. Nobody stated the reason they did not have a meter was because theirs was an illegal connection.

Of course, these survey responses come with the usual caveats about survey questions relating to illegal behavior

## E.5 Unconnected households

The LMCP's objective was to connect all unconnected households to electricity, however, in practice connectivity was not universal. At the average site at least 7% of compounds were not connected to the grid, and at the 90th percentile site at least 25% of households were not connected.<sup>27</sup> The most common reason (given by 31% of unconnected respondents) is that they were not present or available during the days on which construction or sign-up were administered. Second, even though the LMCP program specifications indicate there were to be no upfront connection fees, 23% of respondents still report having been unable to pay, often because they were not able to afford the internal wiring required by Kenya Power to be connected: 16% of unconnected households report this to be the reason. This suggests that despite efforts to provide free ready boards to low-income households, the cost of household wiring remained a barrier that prevented some households from getting connected.

Households could choose not to get connected, but in practice this was rare. Statistics are not available nationwide, but Lee, Miguel, and Wolfram (2020) found that at most 4% of participants in a rural sample in western Kenya randomly selected to receive a free electricity connection chose not to receive one.

Some households preferred to get more than one meter in their compound, for example to leverage the lifeline tariff, or for independence between the households residing in the compound.

## E.6 Experiences with bribery

Households also report numerous instances of bribery. In our household survey data, 8% of households connected under LMCP had been explicitly asked for money by the contractor, with amounts generally ranging from \$5 to \$50. Tragically, a small number of households report having paid an individual claiming to be a contractor, only to never hear from them again and to remain unconnected. 5% of unconnected households report not wanting a connection, for example because they are simply not interested in having electricity or because they think electricity is unsafe (this is similar to the rate reported in Lee, Miguel, and Wolfram (2020) noted above).

## E.7 Contractors

Contractors that bid on LMCP contracts are generally medium-to-large construction firms with a track record of completed projects. Contractors that won the AfDB- and WB-funded LMCP contracts were a mix of Kenyan firms and international firms, with some joint ventures comprised of two or more firms. To qualify, bidders must satisfy certain requirements related to financial capacity, prior experience including with similarly sized jobs, and any record of sanctioning and litigation.

The winners of the 12 AfDB contracts had been selected from 110 bidders. Six of the 10 turnkey contracts winners were Kenyan while four were foreign (Capital Business 2015). The set of contractors awarded WB contracts also included a mix of Kenyan and International firms, with Kenyan firms primarily awarded bids for the supply of wooden and concrete poles.

---

<sup>27</sup>Enumerators only counted unconnected compounds that were within connection distance of the existing electricity network, so this may be an underestimate. [Section 6](#) provides more details on surveying methodology.

There is no blanket provision preventing firms from submitting—or being awarded—bids with both donors simultaneously. Indeed, many of the AfDB contractors named above have in the past bid on—and in many cases been awarded—WB contracts. International procurement can be thought of as a repeated game: poor contract performance can have serious ramifications on long-term outcomes. Several LMCP contractors have been debarred at least once by the WB or the AfDB (Kenya Power, 2018b; Spotlight East Africa, 2020). For example, in October 2018 the WB Sanctions Board imposed “a sanction of debarment” on the Indian company Angelique International for “fraudulent practices as defined in Paragraph 1.16(a)(ii) of the January 2011 Procurement Guidelines.” (WB 2017; WB 2011).

Many of the pole supply firms had existing relations with Kenya Power even prior to the start of the LMCP. As an example, public minutes from a pre-bid meeting for wooden pole procurement organized by Kenya Power in 2014 indicate that eight of the wooden pole suppliers that won WB contracts or AfDB sub-contracts for the LMCP in 2016-2017 were already engaging with Kenya Power as early as 2014, well before the launch of the LMCP (Kenya Power, 2016c), and in many cases even before that (Business Daily, 2007).

## E.8 Oversight

The materials inspections for both funders required detailed mechanical and chemical inspections of 10 poles out of each batch of 500 poles. These visits would usually take place at the physical factory (often located in India, China, or Kenya). However, a number of factory assessments between 2020-2022 had to be conducted via Zoom for public health reasons.

The funders’ oversight structures were similar: the WB’s project manager managed 22 cluster and site supervisors across six offices nationwide, while the AfDB’s project manager managed 19 cluster and site supervisors across four offices nationwide. The consultants’ primary activities during the construction process included conducting site-level spot checks, collecting monthly progress reports from contractors, and hosting (at least) monthly meetings with Kenya Power and each respective contractor.

## E.9 Cost-benefit calculations

The cost-benefit calculations in Section 8 make several simplifying assumptions. They value quality differences according to discounted future costs to replace poles at the end of their useful life. The calculations assume that other maintenance costs are similar, despite differences in construction quality. Each pole is assumed to have a constant probability of failure in any given year. The total number of new connections nationwide is assumed to be as reported in citepKenyaPower20171108. Meanwhile, consistent with survey data from the five counties study area, the total number of poles is assumed to be 1.51 times the total number of new connections. We assume a uniform replacement cost of \$100 per pole (for materials alone), consistent with contract amounts and discussion in (Muthike and Ali, 2021). While the procurement cost per pole was different for AfDB and WB contracts during the LMCP, Kenya Power, not the multilateral donor, is responsible for long-term maintenance and repair and would thus procure these items independently. We assume that about half of total replacement costs is for materials alone, which is roughly consistent with contract amounts in the WB Phase I construction.
